

Local Backup feature Enhancement

Feature

This feature basically allows the Admin user to set a backup path on the server and save the backup of the files and folders(*user_privileges, storage, database backup*) each time he need using a button '***backup now***' available at backup server page in settings module or as usual backing up on logout.

Here the user will be provided with a feature where he can set either FTP backup or local backup or else both.

Backup Server

Enable Backup Server(Local)

The CRM system allows you to make a backup of the database to your FTP server. The CRM will take backup of all data whenever an admin user logs out. Make sure you have enough disk space available on your FTP server. The created backup file will be in the following format: "backup-date-time.sql".

Enable Backup Server (FTP)

Local Backup Enabled
